

Assignment 1

Objective:

Use a DIP switch to toggle an LED. Display the toggle count on an LCD. Once the count reaches 9, keep the LED on..

Components:

- ATmega32 microcontroller
- DIP switch
- LED
- 7 Segments LCD display
- Resistors
- wires

Circuit Setup:

- Connect the DIP switch to an input port on the ATmega32.
- Connect the LED to an output port through a resistor.
- Connect the LCD to the microcontroller.

Programming:

- Initialize the DIP switch as input and the LED as output. DIP switch
- Initialize the LCD for display.
- Monitor the DIP switch. Each toggle increments a counter. Resistors
- Display the toggle count on the LCD.
- Keep the LED permanently on and display "LED ON" when the count reaches 9.

Submission :

- Submit a video to show the system in protous or in real hardware
